

Data Dictionary:

1. Table: Videos

I have set up this table to contain metadata for YouTube videos retrieved via keyword search through discovery.py.

Variable Name	Data Type	Description	Attributes
video_id	String	Unique YouTube identifier for the video.	Primary Key
title	String	The title of the video.	
description	Text	Full text of the video description.	
channel_id	String	Unique ID for the YouTube channel.	
published_at	DateTime	Original upload date/time.	Default: UTC
keyword_matched	String	Search term that triggered the discovery.	
first_seen_at	DateTime	Timestamp when record was added to local DB.	Default: UTC
comments_disabled	Boolean	Flag for videos with locked comment sections.	Default: False

2. Table: Comments

This table contains individual comments from accounts linked to each specific video.

Variable Name	Data Type	Description	Attributes
comment_id	String	Unique YouTube identifier for the comment.	Primary Key
video_id	String	Reference to the parent video.	Foreign Key
parent_id	String	ID of parent comment (if this is a reply).	Nullable
author_hash	String	Anonymized author ID for ethical data handling.	
text	Text	The raw text content of the comment.	
published_at	DateTime	Original comment post date.	Default: UTC
last_updated_at	DateTime	Date of last modification (if edited).	Default: UTC

3. Table: CollectionState

This is an internal tracking table, just for my reference to keep track of when the collection happened, and is used by the script to make sure it doesn't pull the same comment twice.

Variable Name	Data Type	Description	Attributes
---------------	-----------	-------------	------------

keyword	String	The specific keyword being tracked.	Primary Key
last_search_time	DateTime	Timestamp of the last successful API crawl.
